

Shared pipeline:

START -> Fetch unread emails -> Normalize email -> Load thread history
-> Load memory -> Classify intent, urgency, risk -> Route decision

Top-level branches:

1. ignore

Reason: newsletters, spam, or classification.action = ignore

Flow: ignore_email -> update_memory -> mark_processed -> END

2. draft

Reason: low-risk replyable email

Flow: retrieve_context -> draft_reply -> safety_check -> Delivery decision

Delivery decision:

- AUTO_SEND = true and safe_to_send = true -> Auto send

- Otherwise -> Save draft

Then: update_memory -> mark_processed -> END

3. human_review

Reason: low confidence, VIP sender, or sensitive content

Flow: human_review -> Human decision

- approve -> send_or_save

- revise -> revise_reply -> human_review

- reject -> update_memory

Then: mark_processed -> END

Key note:

Auto send is not a top-level branch. It is a delivery outcome inside the draft path.
